

Habitat Suitability Modeling with HEMI 2

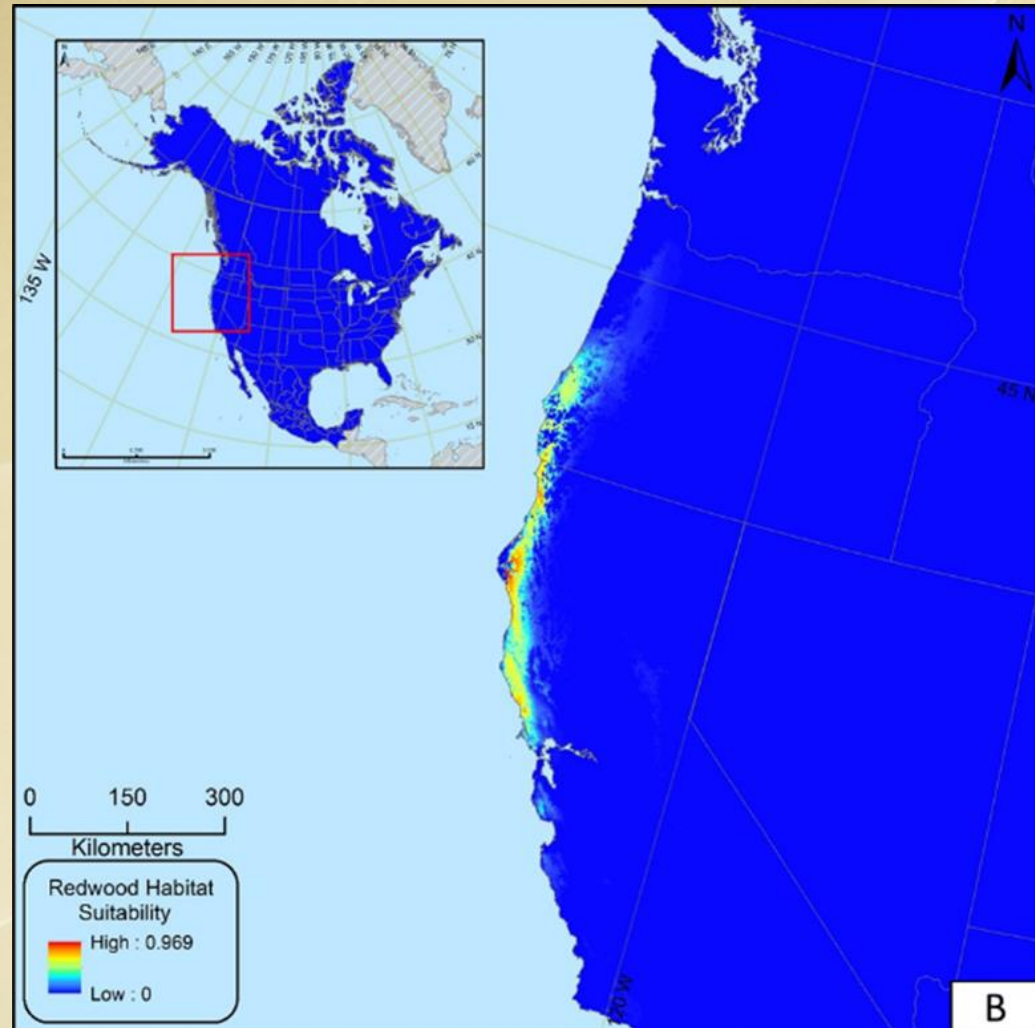

Dr. Jim Graham and
Melissa Kimble
SCGIS

June 24th, 2016

Habitat Suitability Modeling

- Predicts where a species could live, with some uncertainty
- Also known as,
 - Species Distribution Modeling
 - Ecological Niche Modeling

Geographical Space

+ Observed Occurrences

● Realized Niche/Distribution

○ Fundamental Niche/Distribution

○ Model Fitted to Occurrences

Environmental Space

From the Theory of Biogeography

HSM Process

Occurrences (Sample Data)

Spreadsheets

Lat	Lon	Temp	Precip
-105.504	40.35819	5.32	58.4
-107.472	40.498	6.31	47.6

Environmental Layers
(Predictors/Covariates)

Habitat Suitability Map

Map
Generation

Model Parameters

Variable	Param1	Param2
Annual Precip	-0.05	0.0
Annual Temp.	0.61	0.0

Modeling
Method

Spatial Modeling Concerns

- Our data is a combination of:
 - True species habitat constraints
 - Natural history of the species (dispersal & survival)
 - Sampling method
 - Other sources of uncertainty (measurement error)
- What should the models look like?

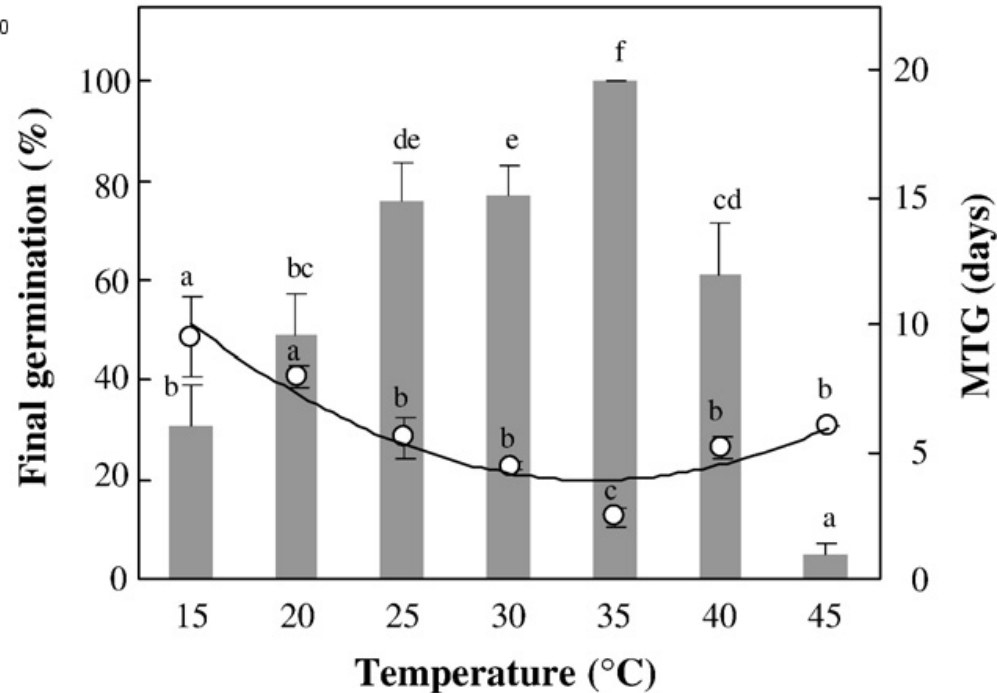

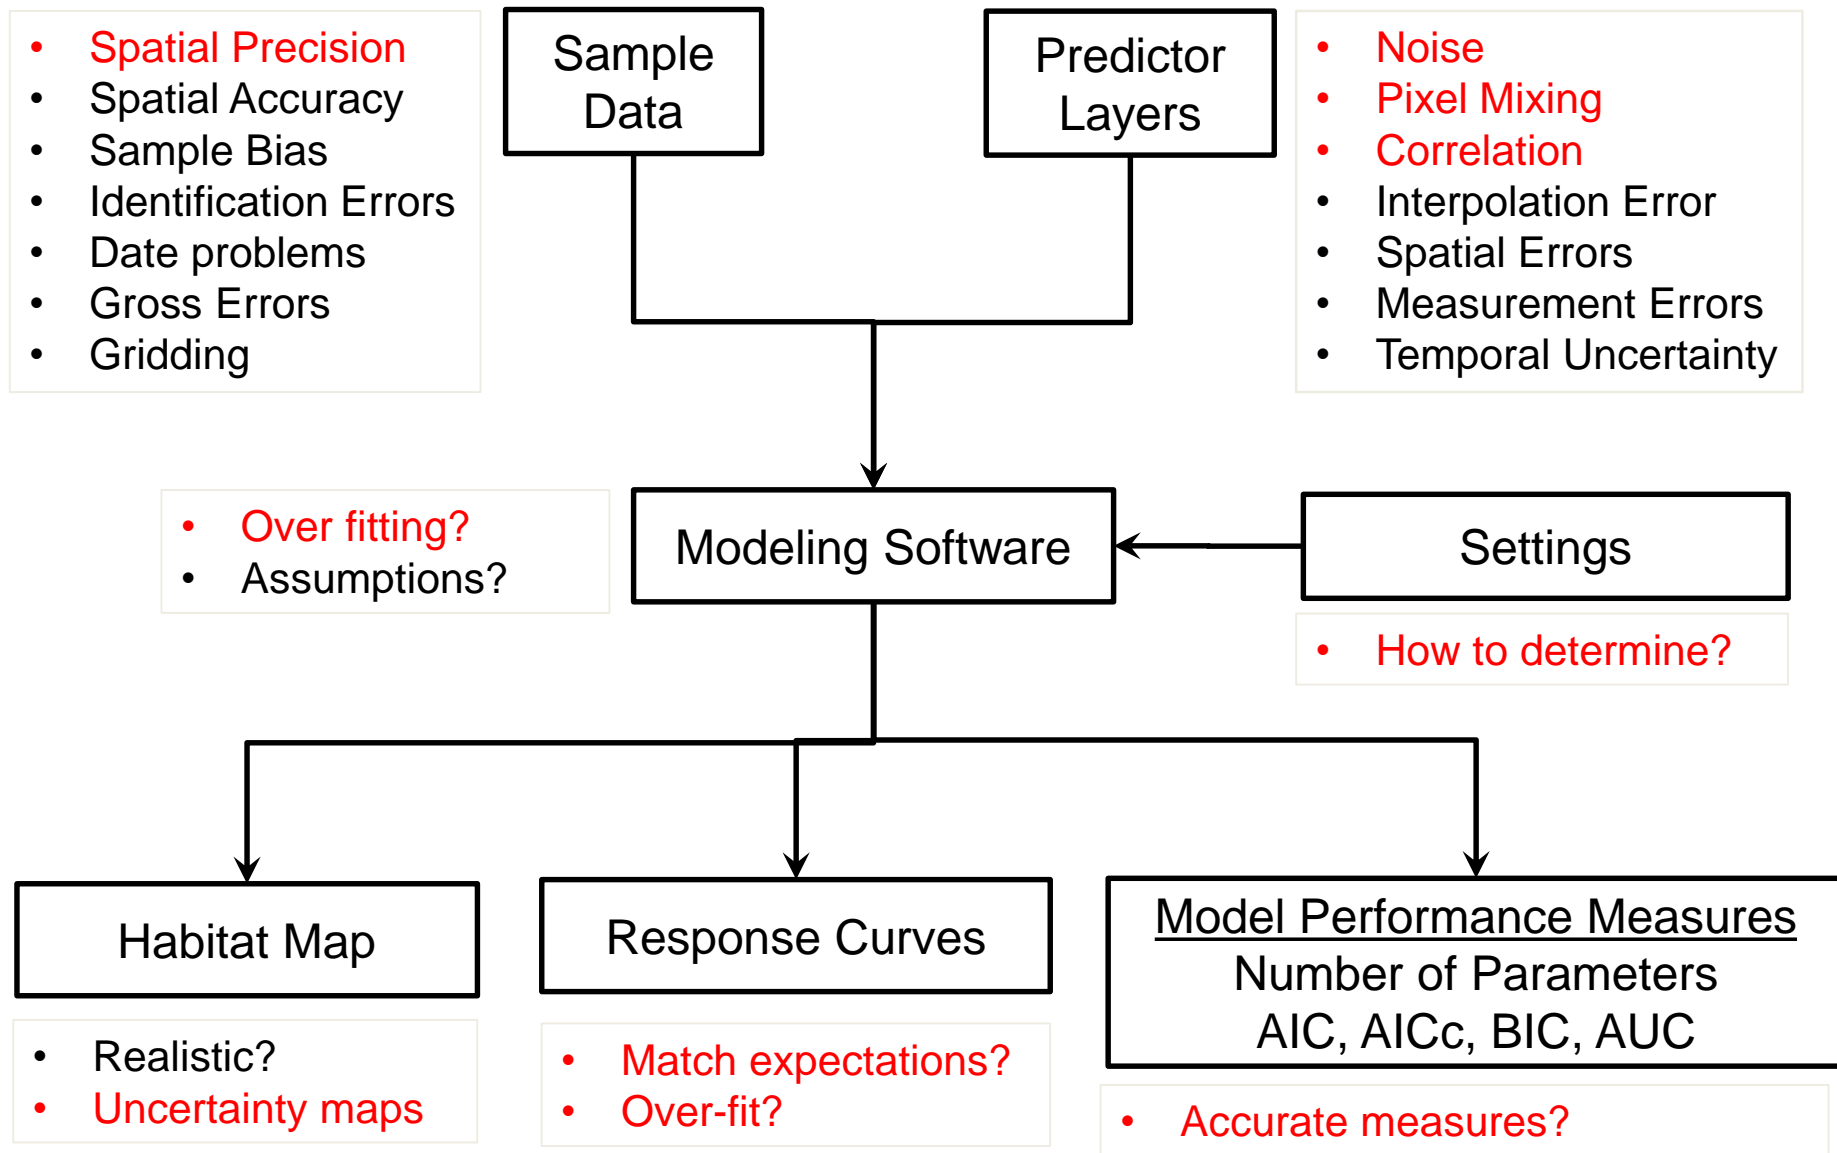

Over-fitting The Data?

Maxent model for *Tamarix* in the continental US: response to temperature when modeled with temperature and precipitation

What should the model look like?

Road Map of Uncertainty

What is the best model?

Our data is the sum of “signals”

- Occurrences are the sum of three signals:
 - Habitat
 - Species dispersal
 - Sampling method
 - Habitat is the lowest “frequency” so we need to “smooth” our models (low-pass filter)
- Environmental Layers (covariate rasters)
 - Cannot represent the complexity on the earth
 - They will hide small, unique, habitats

HEMI 2

- Follow-on to HEMI 1
- Models each environmental variable with smooth Bezier curves
- Multiplies models together to create final HSM
- Includes Monte Carlo methods for: noise injection, cross-validation, sensitivity testing
- Implemented in BlueSpray from SchoonerTurtles.com

Settings

+	AUC: 0.8316 -Log Likelihood: 2035.9 Number of Parameters: 6 AIC: 4083.8	AUC: 0.7889 -Log Likelihood: 946.34 Number of Parameters: 6 AIC: 1904.6	AUC: 0.7769 -Log Likelihood: 826.82 Number of Parameters: 6 AIC: 1665.6

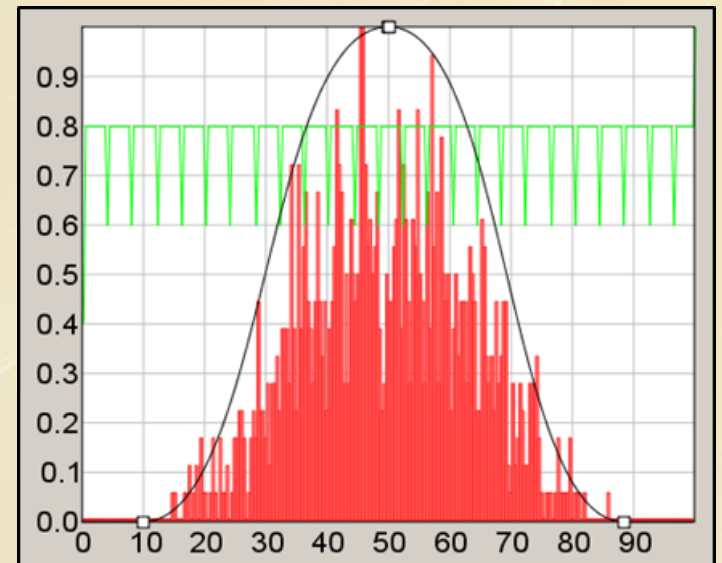

AUC: 0.9306
 -Log Likelihood: 14234
 Number of Parameters: 24
 AIC: 28516

- Sample response curve for precipitation of wettest quarter for Ohio Buckeye
- Control points can be automatically place and manually edited
- AIC and AUC values provided in real time

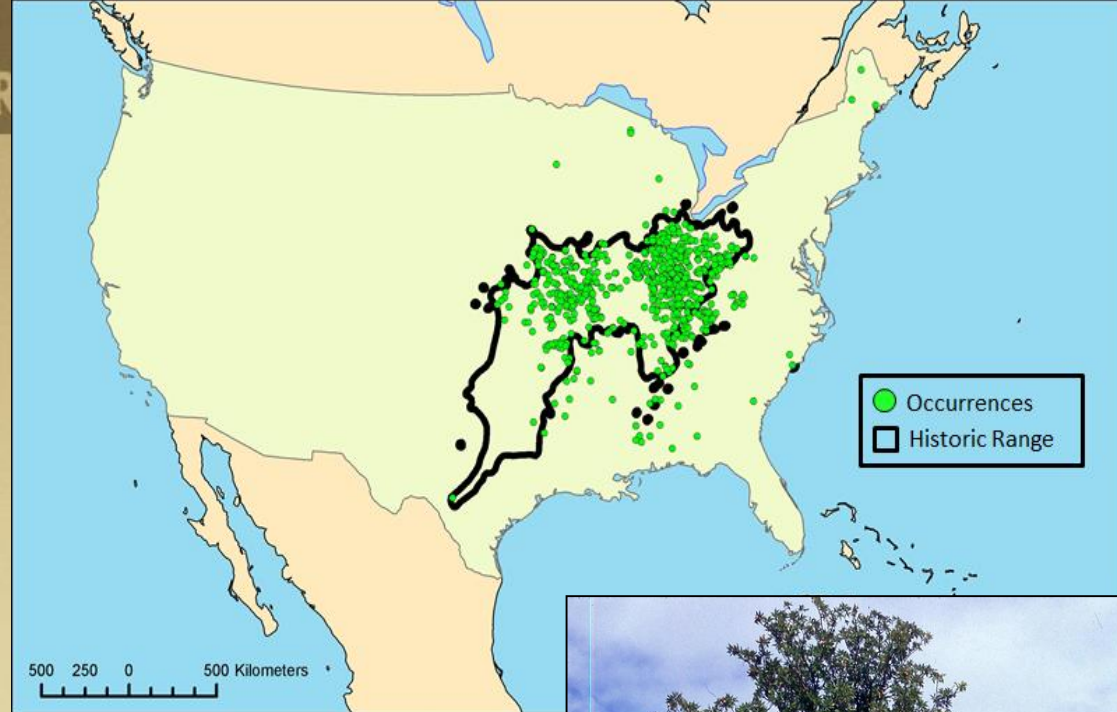

Evaluating HEMI 2

- Occurrences:
 - Synthetic Data
 - Forest Inventory Analysis (FIA) database
- Environmental Variables:
BioClim/WorldClim

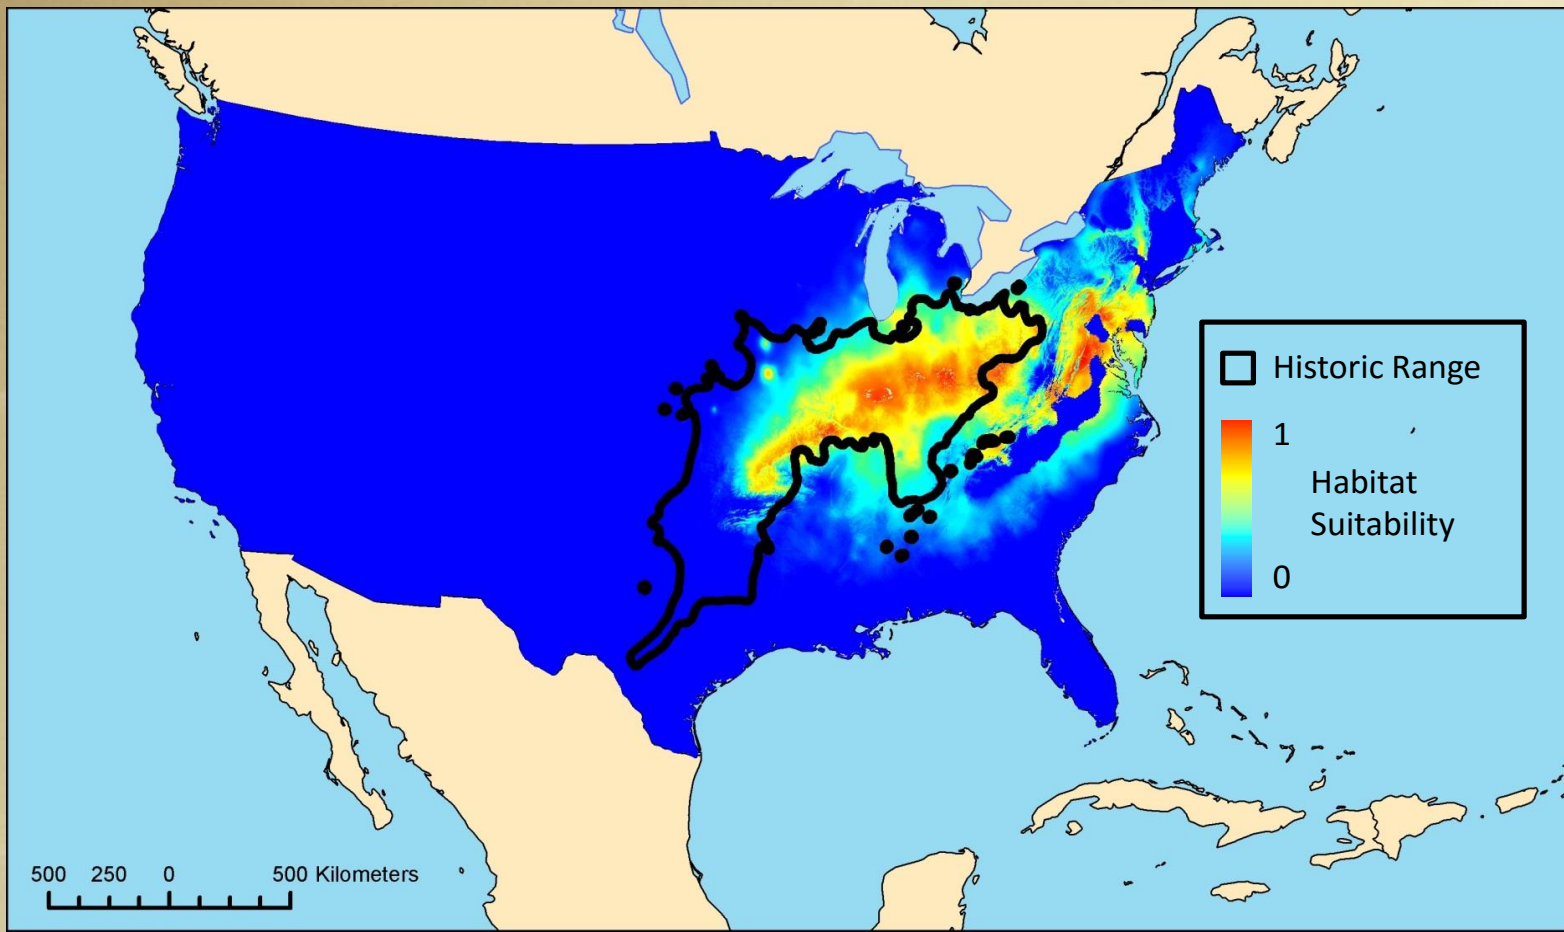

Ohio Buckeye

- Precipitation:
 - 30 to 60 inches
- Temperature :
 - Cold required
 - Min of 145 frost free days
 - Min temp. of -33 degrees F
- Soil:
 - pH ranged from 5.0 to 7.1
 - fine to medium textured soils

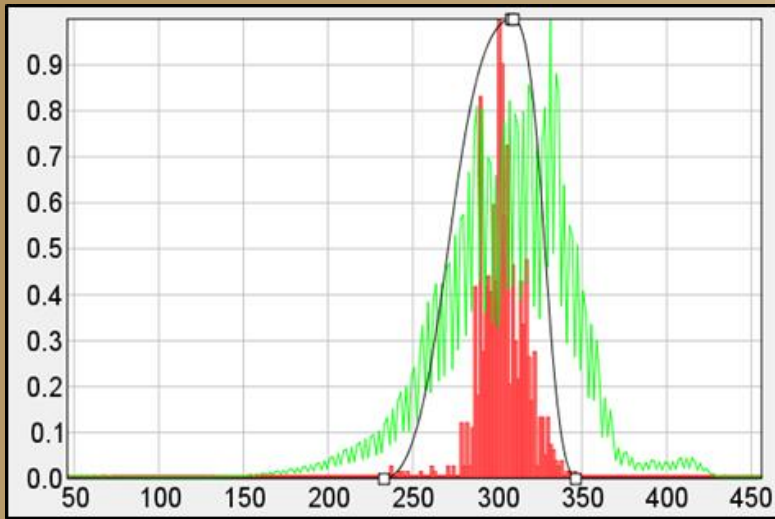

Environmental variables	Mean AIC	Mean AUC
BIO5_MaxTemp, BOI6_MinTemp, BIO15_PrecipSeason, BIO18_PrecipWetQuarter	28516	0.930
BIO5_MaxTemp, BOI6_MinTemp, BIO17_PrecipDryQuarter, BIO18_PrecipWetQuarter	28637	0.927
BIO5_MaxTemp, BOI6_MinTemp, BIO15_PrecipSeason	28687	0.924
BIO5_MaxTemp, BOI6_MinTemp, BIO18_PrecipWetQuarter	28701	0.933

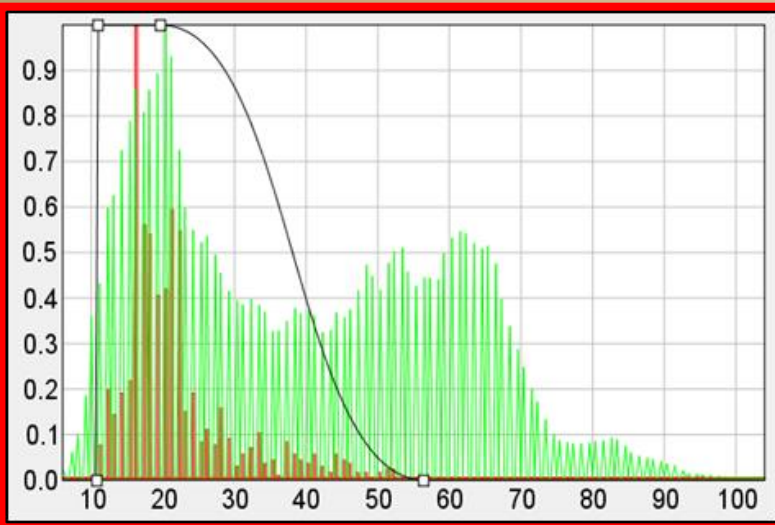

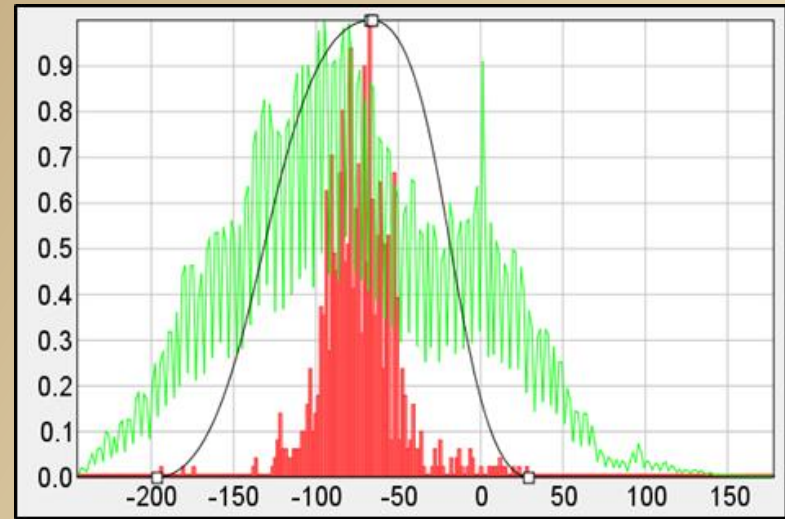

Response Curves

HEMI 2 – Summary

- Noise Injection:
 - Occurrences
 - Environmental Variables/Covariates
- Cross-Validation
- Sensitivity Testing
- Jackknife for environmental variable selection
- Analysis for number of iterations
- Detailed web page outputs
- Monte Carlo methods available for MaxEnt

Next Steps

- Memory and performance optimization
- Allowing more complex curves?
- Running models for additional species!
 - Predicting future habitat based on global change with uncertainty maps
- What do you need?
